

Claims

What is claimed is:

1. A client/server system facilitating workflow of the web server to attach representations of non-HTML objects to a HTML object, said system comprising:
- a web server;
 - one or more databases associated with the web server;
 - one or more non-HTML objects stored on the one or more databases; and
 - a client comprising a browser, the browser being operable to communicate a request to the server to access the one or more non-HTML objects;
- wherein the web server, upon receipt of said request, retrieves the one or more non-HTML objects, translates the one or more non-HTML objects to an HTML representation of that object and stores the HTML representation of that object with an HTML object and performs a task based on the occurrence of an event.
